Issue of VQA Bias

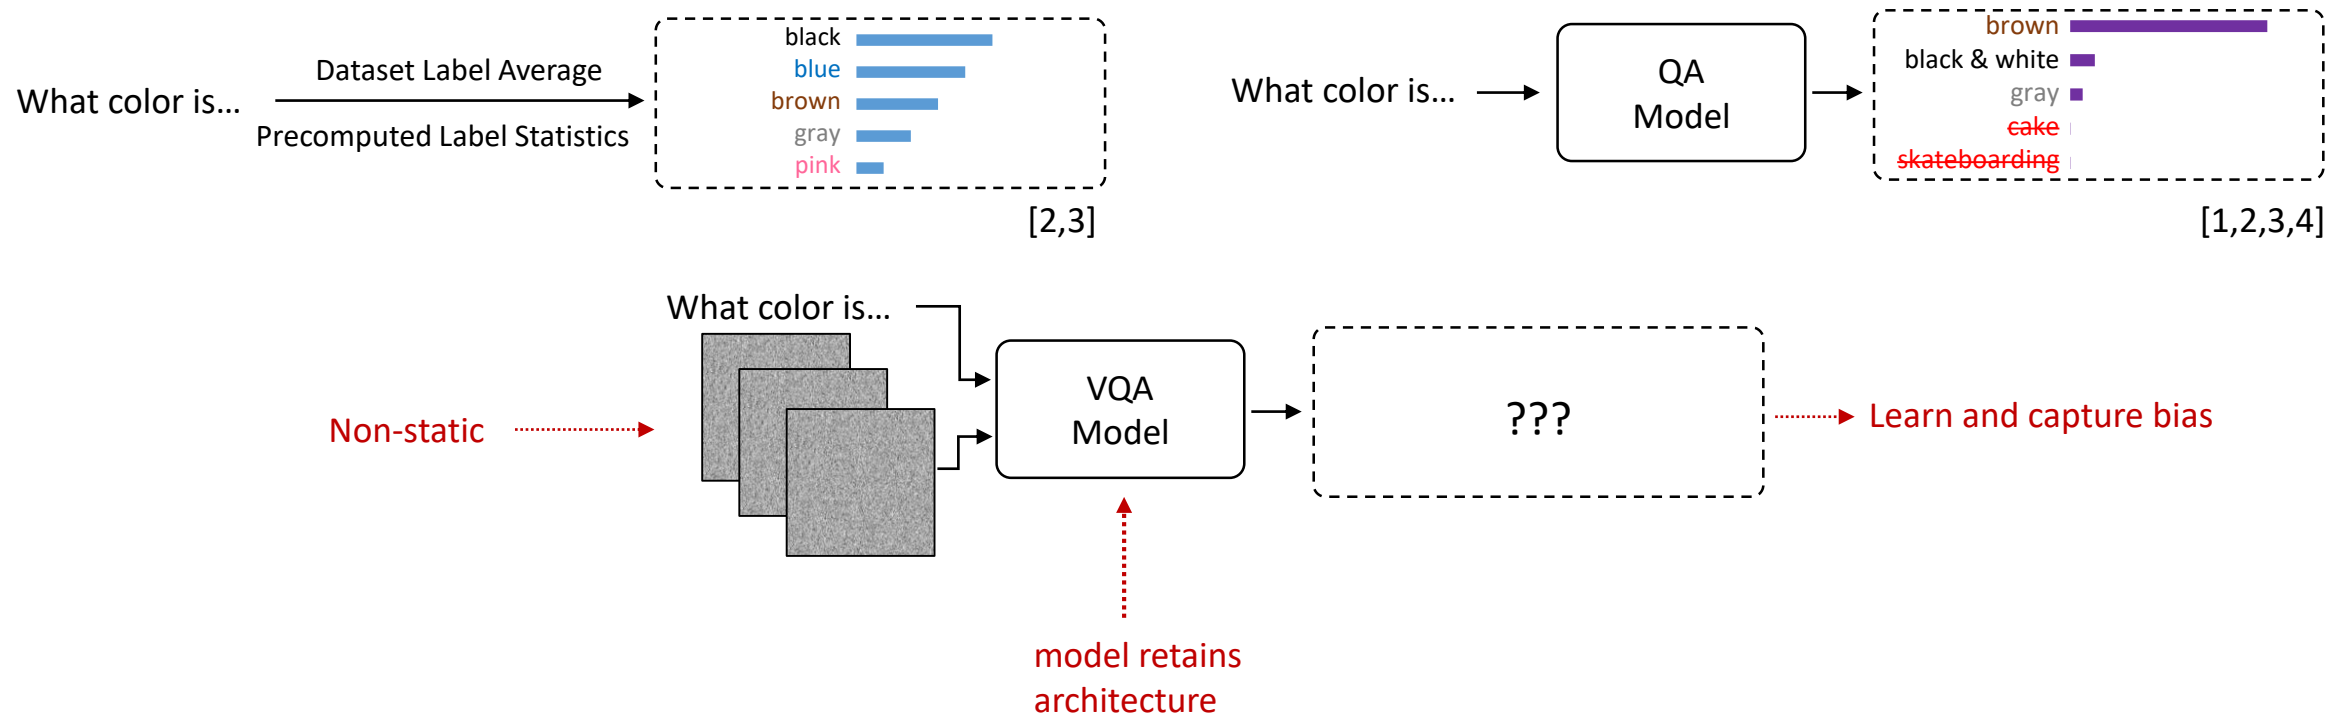

What the VQA model actually experiences

The better we can capture bias, the better we can debias

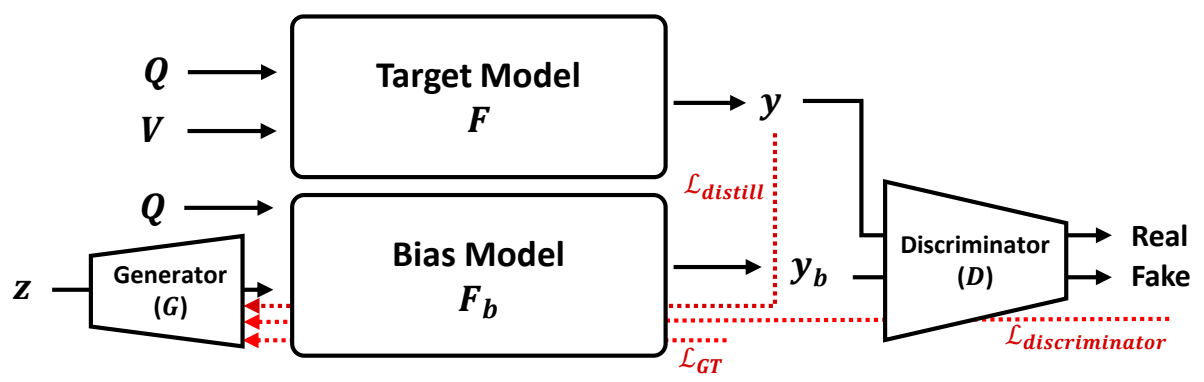

[1] Cadene R., RUBi: Reducing Unimodal Biases in Visual Question Answering. NeurIPS 2019.
 [2] Clark C., Don't Take the Easy Way Out: Ensemble Based Methods for Avoiding Known Dataset Biases. EMNLP 2019.

 [4] Counterfactual VQA: A Cause-Effect Look at Language Bias. CVPR 2021.

Generative Bias for Robust VQA

Full training of the bias model

Bias Issue

VQA models rely heavily on **language priors!**

Example 1

Train

Q+[A] What color is the dog ? [White]

Image 

Training Prior

- white
- red
- blue
- green
- yellow
- ...

Test

Q+[A] What color is the dog ? [Black]

Image 

Models

SAN GVQA

White Black

Example 2

Q+[A] Is the person wearing shorts ? [No]

Image 

Training Prior

- no
- female
- woman
- ...

Q+[A] Is the person wearing shorts ? [Yes]

Image 

Models

SAN GVQA

No Yes

Bias?

Two commonly used statistics for debiasing in VQA

[1] Cadene R., RUBi: Reducing Unimodal Biases in Visual Question Answering. NeurIPS 2019.

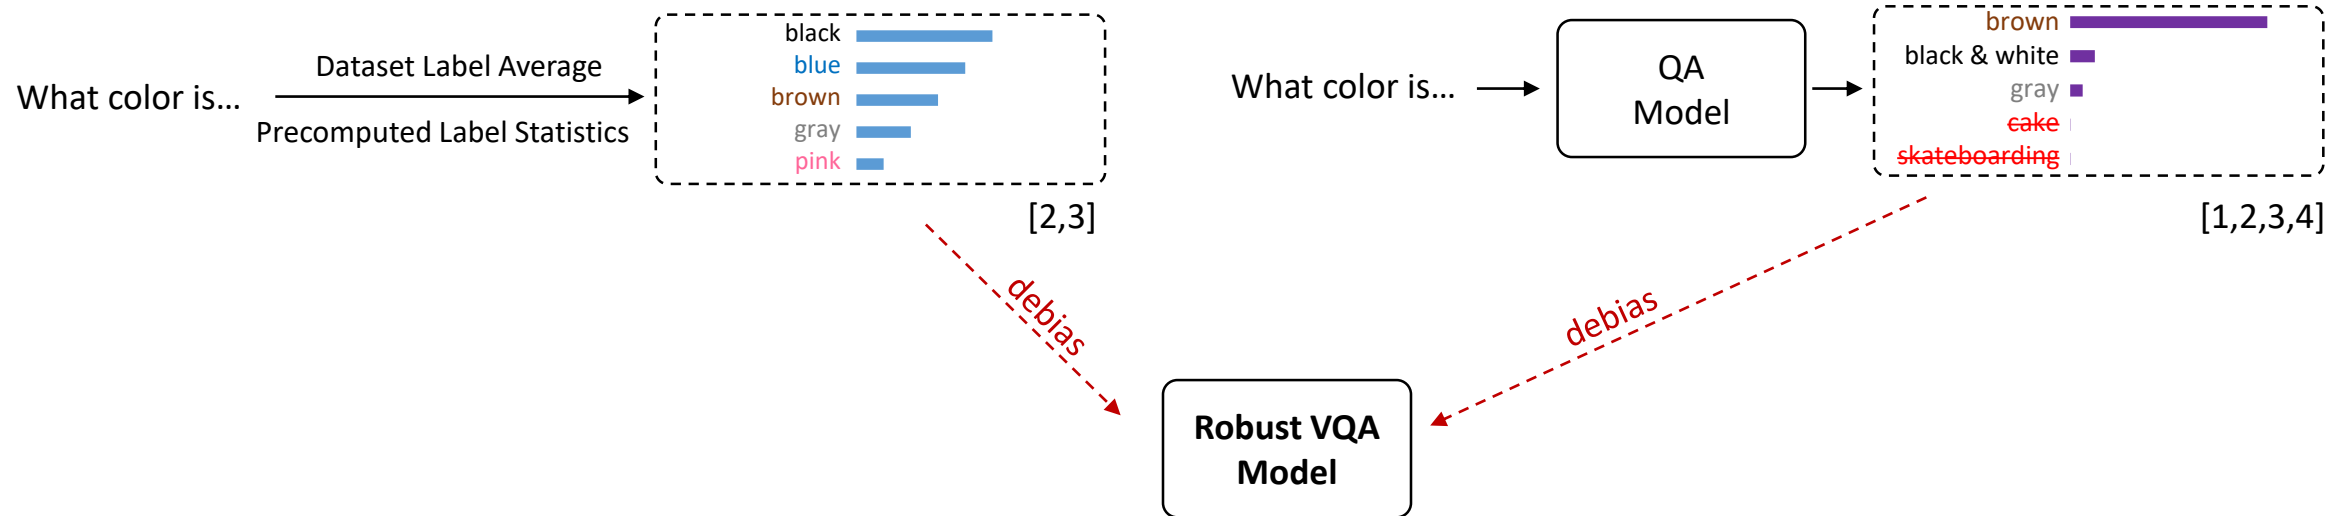

[2] Clark C., Don't Take the Easy Way Out: Ensemble Based Methods for Avoiding Known Dataset Biases. EMNLP 2019.

[3] Han X., Greedy Gradient Ensemble for Robust Visual Question Answering. ICCV 2021.

[4] Counterfactual VQA: A Cause-Effect Look at Language Bias. CVPR 2021.

Bias?

Generative Bias for Robust VQA

Full training of the bias model

Ensemble Training

Bias Model captures *bias* and **Target Model** learns to *debias* from it

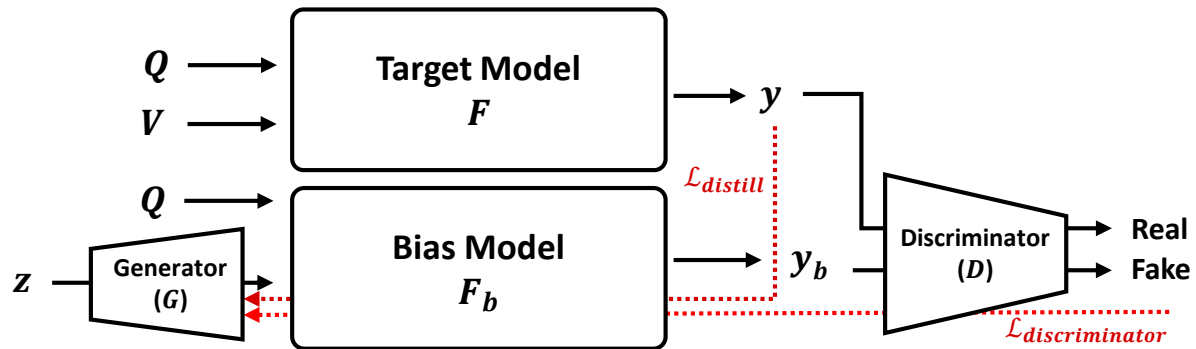

Bias Model Training

Learns **distribution Bias**

Bias Model Training

Learns the **Target Model's bias**

Bias Model Training

The bias model generates **stochastic bias representations**

Intuitively, Generator learns to *“hallucinates”* the *“visual input”*

Generative Bias for Robust VQA

Target model debiasing

Bias Model's output as negative gradient supervision

$$\mathcal{L}_{target}(F) = \mathcal{L}_{BCE}(\mathbf{y}, \mathbf{y}_{DL})$$

with,

$$\mathbf{y}_{DL}^i = \min(1, 2 \cdot \mathbf{y}_{gt}^i \cdot \sigma(-2 \cdot \mathbf{y}_{gt}^i \cdot \mathbf{y}_b^i))$$

Using the raw unbounded output + clamping allows our loss to take into consideration the **intensity** of bias

Generative Bias for Robust VQA

Excellent performance
